Objectives of the Course

And Preliminaries

## Some Information

- **Instructor:** Dr. Nathalie Japkowicz
- **Office:** DMTI-112B
- **Phone Number:** (202) 885-6486 (don't rely on it too much!)  
**Assignment Project Exam Help**  
**<https://powcoder.com>**
- **E-mail:** japkowicz@american.edu (best way to contact me!)  
**Add WeChat powcoder**
- **Office Hours:**
  - Thursdays, 2:30pm-4pm
  - By arrangement, on Skype

# Machine Learning: A Case Study

- Malfunctioning gearboxes have been the cause for CH-46 US Navy helicopters to crash.
- Although gearbox malfunctions can be diagnosed by a mechanic prior to a helicopter's take off, what if a malfunction occurs while in-flight, when it is impossible for a human to detect?

- Machine Learning was shown to be useful in this domain and thus to have the potential of saving human lives!

# How did it Work?

Consider the following common situation:

- You are in your car, speeding away, when you suddenly hear a “funny” noise.
- To prevent an accident, you slow down, and either stop the car or bring it to a safe place.

- The in-flight helicopter gearbox fault monitoring system was designed following the same idea. The difference, however, is that many gearbox malfunction cannot be heard by humans

# So, Where's the Learning?

- Imagine that, instead of driving your good old battered car, you were asked to drive this truck:

- Would you know a “funny” noise from a “normal” one?
- Well, probably not, since you’ve never driven a truck before!
- While you drove your car during all these years, you effectively learned what your car sounds like and this is why you were able to identify that “funny” noise.

# What did the Computer Learn?

- Obviously, a computer cannot hear and can certainly not distinguish between a normal and an abnormal sound.
- Sounds, however, can be represented as wave patterns such as this one.

which in fact is a series of real numbers indicating intensity.

- And computers can deal with strings of numbers!
- For example, a computer can easily be programmed to distinguish between strings of numbers that contain a “3” in them and those that don’t.

# What did the Computer Learn? (Cont'd)

- In the helicopter gearbox monitoring problem, the assumption is that functioning and malfunctioning gearboxes emit different sounds. Thus, the strings of numbers that represent these sounds have different characteristics.
- The exact characteristics of these different categories, however, are unknown and/or are too difficult to describe.
- Therefore, they cannot be programmed, but rather, they need to be learned by the computer.
- There are many ways in which a computer can learn how to distinguish between two patterns (e.g., decision trees, neural networks, bayesian networks, etc.) and that is the topic of this course!

# What else can Machine Learning do?

- Medical Diagnostic (e.g., breast cancer detection)
- Credit Card Fraud Detection
- Sonar Detection (e.g., submarines versus shrimps (!) )
- Speech Recognition (e.g., Telephone automated systems)
- Autonomous Vehicles (useful for hazardous missions or to assist disabled people)
- Personalized Web Assistants (e.g., an automated assistant can assemble personally customized newspaper articles)
- And many more applications...

# Text Books and Reading Material

- **Peter Flach**, *Machine Learning: The art and science of algorithms that make sense of data*. Cambridge University Press, 2012.
- **Nathalie Japkowicz and Mohak Shah**, *Evaluating Learning Algorithms: A Classification Perspective*, Cambridge University Press, 2011.
- **Research papers** saved in the directory entitled literature on Blackboard
- On Blackboard, you will also find a list of non-required books that you may find useful.

# Objectives of the Course:

- To present a broad introduction of the principles and paradigms underlying machine learning, including discussions and hands-on evaluations of some of the major approaches currently being investigated.
- To introduce the students to the reading, presenting and critiquing of research papers.
- To initiate the students to formulating a research problem and carrying this research through.

## Format of the Course:

- The course is lecture based.
- Each student will write 6 research paper critiques as part of a group of 2 or 3 students.
- Each student is expected to present in class, one of the 13 papers provided in the literature packet. (Each student will present a different paper). The student presentations will take place during the weeks of November 26 and December 3.
- On the last day of classes, each student will present a poster to the entire class (and the whole department). This poster will be based on the research they will have carried out for their final project.
- There will be an in-class midterm exam on November 1, but no final exam.
- There will be two assignments and a final project.

## Contents of the Course I :

- The course will teach machine learning algorithms, theoretical issues and contemporary problems in machine learning.

Assignment Project Exam Help

- Machine learning algorithms covered:

Decision Trees

Artificial Neural Networks

Bayesian Learning

Instance-Based Learning

Support Vector Machines

Ensemble-Learning Algorithms

Rule Learning/Associative Rule Mining

Unsupervised Learning/Clustering

## Contents of the Course II:

The roots of Machine learning (Philosophy, AI, Computational Learning Theory, Statistics)

- Theoretical issues considered:
  - Learning Algorithms

<https://powcoder.com>

Add WeChat powcoder

Data Exploration

Data Preparation

- Practical issues considered:

Feature Selection

The Class Imbalance Problem

# Contents of the Course III:

Contemporary themes considered:

We will be specifically looking at the area of big data analysis, and, possibly, at some of the following topics:

Assignment Project Exam Help

Deep Learning

Graph Mining

Mining Social Networks

Data Streams Mining

Unstructured or Semi-Structured Data Mining

Data Mining with Heterogeneous Sources

Spatio-Temporal Data Mining

Issues of Trust and Provenance in Data Mining

Privacy in Data Mining

Cybersecurity

of the  
Final  
Grade**

## Course Requirements:

- Written commentaries

} **12%**

- Oral presentation of a research paper

} **8%**

- 2 Assignments (little programming involved as programming packages will be provided)

} **20%**

- Midterm Exam

} **25%**

- Final Project: - Project Proposal  
- Project Report  
- Poster Presentation

} **35%**

# More on Assignments and Final Exam:

- **Assignment 1:** **Assignment Project Exam Help**
  - Handed out on: Thursday September 27, 2018
  - Due on: Thursday Oct 18, 2018 <https://powcoder.com>
- **Assignment 2:** **Add WeChat powcoder**
  - Handed out on: Thursday Oct 18, 2018
  - Due on: Thursday November 15, 2018
- **Midterm Exam:**
  - In class on Thursday November 1, 2018

## More on the Research Project (Also see the Project Description on Blackboard)

- **Research Project** including a literature review and the design and implementation of a novel learning scheme or the comparison of several existing schemes.
- **Projects Proposal** (3-5 pages) are due on October 25, 2018
- **Project Report** are due on December 6, 2018
- **Project Presentation** will take place on December 6, 2018 in the form of a poster presentation.
- Suggestions for project topics are listed on Blackboard, but you are welcome (and that's even better) to propose your own idea.

**Start thinking about the project early!!!!**
